GETTING STARTED

The *FE Tracking* App can be used as an addition to the [Fast Events WordPress plugin](#). The App offers participants - especially in sports events - the possibility to show a track including points of interest and checkpoints along the route. The App records the date and time of passing the checkpoints and automatically uploads them to the event organisation's server.

TYPICAL USE

Use the App to scan a printed ticket or a downloaded PDF ticket. Turn recording on at the start of the route, turn off the screen and put it in a bracelet, for example. Stop recording at the end of the track and show the finish/Exit qrcode to the organisation in order to receive, for example, a medal or any other form of proof of participation.

The event organiser can also choose to make real-time messages and real-time track updates available to the user of the FE Tracking App. Users can also share their track with family and friends while walking, cycling, etc

- **Install the *FE Tracking* App:** [Installation](#)
- **Overview:** [Usage overview](#)
- **Global Settings:** [Settings](#)
- **Changelog:** [Changelog](#)

2.1 Installation

The *FE Tracking* App is available for Android 8.0 and later and IOS 10.0 and later.

2.1.1 Battery optimization

Unfortunately, some **Android device manufacturers** have made it a “sport” to optimize battery usage in such a way that Apps running in the background (such as *FE Tracking* when it is recording) are forcefully shut down. Alarm Apps, Health Apps and Location Apps are then the victims of this policy, while the standard Android version usually handles this well. Also if battery optimisation Apps are used (Android and IOS) it can have a negative impact on *FE Tracking*. If such Apps are used make sure that *FE Tracking* is excluded from optimization, if possible.

If this happens to you, remember this is not an App problem, but it is a Device manufacturer problem.

Check [this site](#) to find out if your phone uses device-specific optimisations. The general rule is to exclude the *FE Tracking* App from battery optimisation rules, if possible. Often these settings are deeply “hidden” in the phone’s settings.

2.1.2 Further optimizations

FE Tracking is very battery-conscious. When track recording is enabled it will automatically start recording a location according to the configured distanceFilter (meters). When the device is detected to be stationary, *FE Tracking* will automatically turn off location-services to conserve energy.

Nevertheless, further optimisations are certainly possible in order to use the battery as efficiently as possible.

1. As mentioned earlier, make sure *FE Tracking* is excluded from battery optimisations.
2. Do not run other Apps in the background. Make sure *FE Tracking* is the only App running in the background.
3. Avoid using social media Apps and streaming Apps. They are known as notorious battery abusers. Search on the Internet for `social media App battery usage` and you will find good suggestions.
4. If you pause for more than 5 minutes while walking, cycling, ... temporarily turn track recording off and turn it on again when you continue.
5. The amount of data that *FE Tracking* uses for checkpoints and optional news and track updates is very limited and in most situations is not more than a few 10-kilobytes. For very long routes it might be a few megabytes. This data will almost always be sent via the mobile data network. Check your mobile operator’s coverage map to see which type of network (3G, 4G or 5G) has the best coverage. Most phones constantly scan all networks for the best possible coverage, which of course drains battery power. By locking the phone to one type of network (where coverage is good for the entire route) in the phone’s settings, you can prevent this scanning.
6. If you are walking, cycling, ... with a group of colleagues or friends, it is also possible to create a personal WiFi hotspot on one of the devices. Turn off mobile data on all other devices and connect to the hotspot via WiFi. These devices will save quite a bit on battery power.
7. Of course, you can also buy a small power bank and connect it to your phone. This way you will always have enough power available. Especially for long tracks or tracks that take all day, this is highly recommended.
8. While recording the route, you can use the App to check where you are on the track and see how far you are from the next checkpoint, first aid post, etc... At that moment, map data will be downloaded, which of course happens via the mobile data network and will drain the battery and possibly your mobile data bundle. The App uses a map cache, so once a map segment has been downloaded, the next time it is used, the segment is retrieved from the cache. This saves time and money. So if you are at home and have a WiFi connection, you can already explore the track and scroll through it with different zoom levels to fill the map cache. A great time and cost saver for your mobile data bundle and your battery.

2.1.3 Languages

FE Tracking supports standard two languages: English and Dutch. You can add your own language by following the next steps:

1. Make sure you have a [Github](#) account.
2. Check the `languages` folder of <https://github.com/fe-data/fe-tracking-languages> if your language is supported.
3. If not, login with the Github account at <https://gitlocalize.com/repo/6402>.
4. Create a new issue in <https://github.com/fe-data/fe-tracking-languages/issues> requesting the new language code. We will give you the role of moderator for the new language. Use the two letter codes from [this source](#). Only LTR-languages are supported.

As moderator you may receive review requests from other translators. Process them and when you are happy with the update create a pull request. Mind you:

1. We will only process pull request which origin from Gitlocalize and no pull requests from private forks.
2. For initial translations we only accept a full translation of the whole file. Partial translations will be rejected.
3. Once we have processed the pull request, the translation will be available for the App within 15 minutes if you re-install the App. If you don't re-install the App it may take up to 12 hours before the App is aware of the new language.
4. There is only 1 moderator per language.

2.2 Overview

2.2.1 First time use

The first time the *FE Tracking* App is launched, a warning is shown that the App uses location data to determine where the phone is in order to check whether a checkpoint has been passed. When using different parts of the App, you will be asked for permission to use e.g. the camera or location data.

2.2.2 Permissions

Permissions are required to use certain parts of the App. Permission is only asked for when the respective component is used.

Camera If a ticket is scanned with the camera to add a track to the tracks overview, it is necessary to give permission to the App to use the camera when the App is in use.

Location As soon as a map of the track is shown or live recording is turned on, permission is needed for the App to use location data. This is done in two steps. First, permission must be given to use location data when the App is in use and, as a final step, permission must be given to use it all the time. This is shown as *Always* (iOS) or *Allow all the time* (Android). So even when the App is closed or running in the background, location data will be used.

Motion & Fitness / Physical activity This permission is requested at the same time as the location permission. The App samples the accelerometer periodically while tracking in order to power-down the GPS as soon as the device is determined to be stationary, while stopped for a break, for example.

Background Location Access

FE Tracking collects location data, if tracking is enabled, to track you on tracks and when you pass checkpoints. This also happens when the application is closed or not in use.

The date and time is passed to the event organisation's server when a checkpoint is passed.

Close

Fig. 1: Warning screen

Files and media If a track is added to the tracks overview by scanning a PDF containing the etickets, permission is required.

Background App Refresh (iOS only) This permission is requested at the same time as the location permission. This is necessary in order for the App to continue to operate in the background.

2.2.3 Permission overview

Warning: Periodically, both iOS and Android will show reminders that the App can always request location data and if the App is not used for a long time, this permission will be withdrawn. So if the App has not been used for a long time and it is restarted again, make sure that the location permission is set to `Always` for iOS or `Allow all the time` for Android.

2.3 Settings

All changes made to the settings are applied immediately.

2.3.1 Checkpoint settings

Sound Make a sound when you approach a checkpoint, if this setting is switched on.

Text-to-speech A spoken text is played when you approach a checkpoint, if this setting is switched on. See also the next setting.

Text-to-speech format This is the sentence that is spoken when you approach a checkpoint. The {} part is the name of the checkpoint.

2.3.2 News settings

An event supports real-time messages if the icon is visible in the tracks overview for the track in question.

Sound A short sound is played as soon as a news item comes in, if this setting is switched on.

Text-to-speech The message is spoken as soon as a news item comes in, if this setting is switched on. See also the next setting.

Text-to-speech format This is the sentence that is spoken when a news item comes in. The {} part is the message.

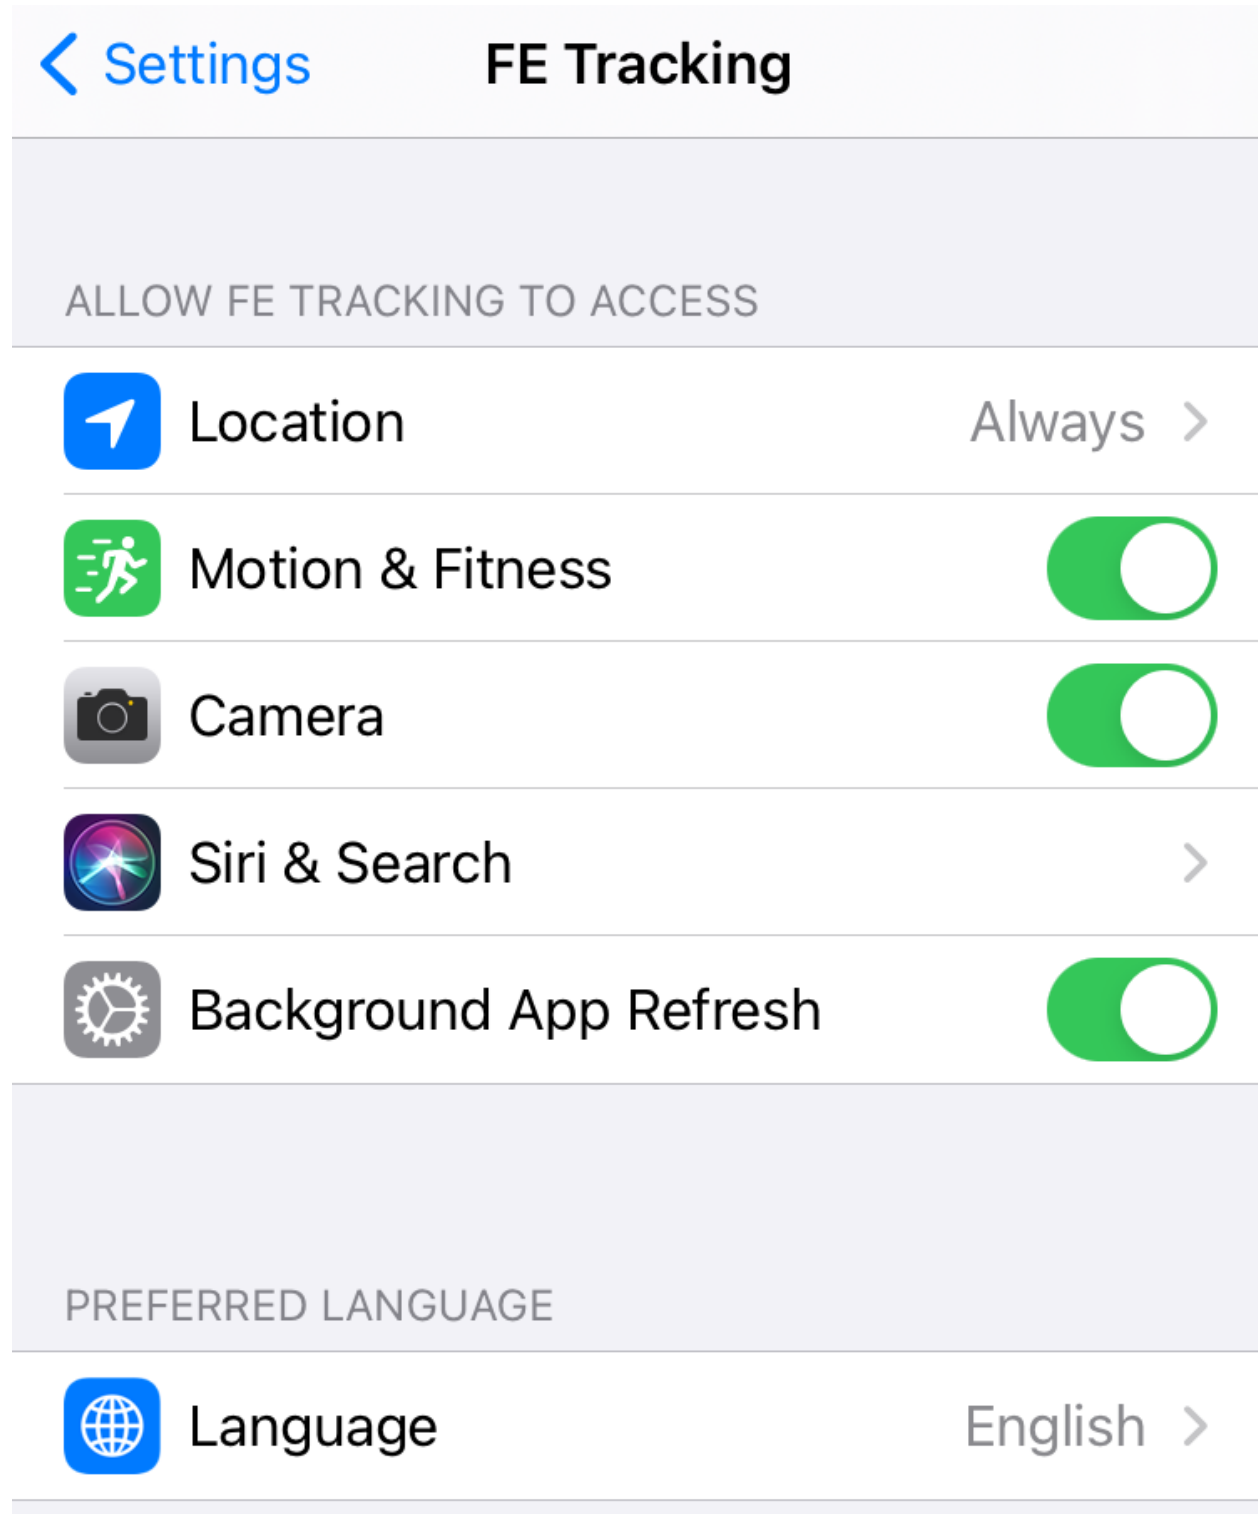

Fig. 2: Overview IOS permissions

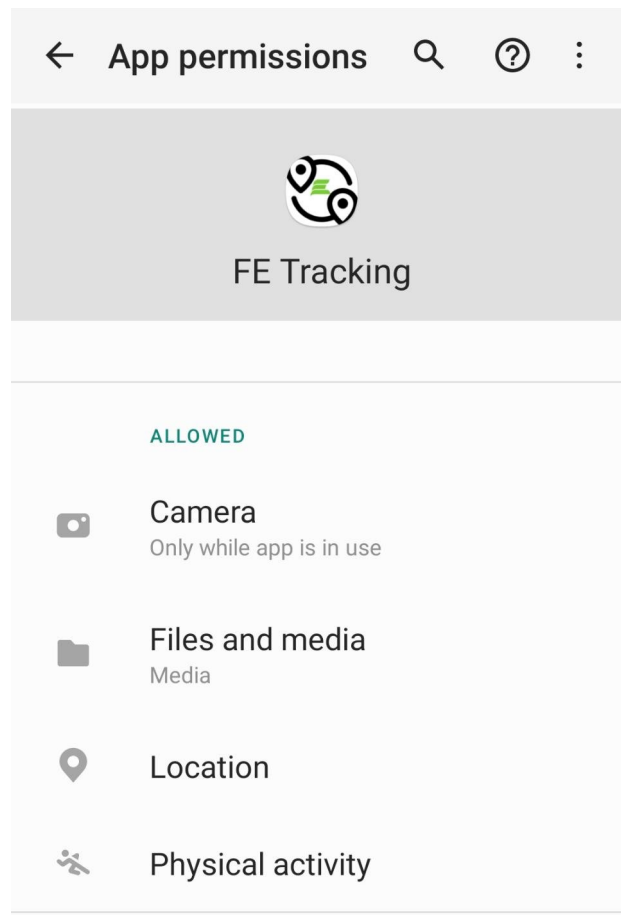

Fig. 3: Overview Android permissions

2.3.3 Map settings

Disable checkpoint circles The checkpoints on the track are shown as light grey circles and light green circles when a checkpoint is passed. Disabling this option has no effect on the indication of whether a checkpoint has been passed or not. If uploading is selected, the date and time of passing the checkpoint is still sent to the event organisation's server.

Realtime sharing Use real-time track sharing with your family, friends, etc while you are walking, cycling, running, ... This is only possible if the event organiser allows sharing and if this switch is on.

Track color The colour of the track on the map. Click on the coloured circle to change its colour.

Track line width The line width (1 - 10) of the track.

Location color The colour of the current location and direction on the map. Click on the coloured circle to change its colour.

Live tracking color The colour of the line of the track travelled. Click on the coloured circle to change its colour.

Live tracking line width The line width (1 - 10) of the track travelled.

Export file type The file format (GPX or KML) used in the map part of the App to share the travelled track with another App.

2.3.4 General settings

Share track link Invitation format of the track which can be shared via e.g. email, WhatsApp, Signal, ... The **{event}** keyword is replaced by the name of the event and **{link}** by the actual share link. If a user clicks the link, the share will be added to the `Shared tracks` of the App. If the App is not installed, the user will be asked to install the App.

Audio silence period Android only. If the sound output is set to bluetooth, some phones may skip the first part of the spoken text. This is because it can take some time for the bluetooth connection to be established. Use this parameter to delay the text by a few milliseconds.

2.3.5 Reset App

Reset all settings to their default values. This does not affect existing tracks that have been or will be travelled.

2.4 Changelog

2.4.1 v1.3 (25 October 2021)

- New: Share your track with your family and friends in real time while walking, cycling, ... Only if the event organization allows sharing and if sharing is enabled in the App settings.
- Changed: Android 8.0 is now the minimum supported version
- Better error handling

Reset App

Reset all settings and stop background location tracking. Your list of tracks and recordings will be preserved.

Reset App **Cancel**

Fig. 4: Reset App screen

2.4.2 v1.2.1 (7 October 2021)

Small bug fixes.

2.4.3 v1.2 (29 September 2021)

- New: Import a track directly from the order-page or a received email, using deeplinks. You no longer need to scan or print the ticket.
- Fixed: Increased PDF scan resolution.
- Upgraded internal components.

2.4.4 v1.1.2 (14 September 2021)

- Fixed: App can block during startup if there is no network coverage

2.4.5 v1.1.1 (7 September 2021)

- Fixed: Used wrong API-version in communication with server
- Fixed: Don't allow browsing outside pan area
- Fixed: Keep map centered if device is moving
- Fixed: Warn if Text-To-Speech language is not available

2.4.6 v1.1.0 (31 August 2021)

- New: Realtime news from the event organizer
- New: Realtime track updates
- New: Manual checkpoint synchronisation with the event organisation's server in the case of errors
- New: Labels below the bottom navigation icons in the Information screen
- Changed: Event name is now part of the notification icon (Android only)

2.4.7 v1.0.1 (26 June 2021)

- Privacy policy updated

2.4.8 v1.0.0 (25 June 2021)

- First release

How to use the different menu choices.

3.1 Tracks

3.1.1 Overview

This is the default start screen of the App. It gives an overview of all the tracks that have been or still need to be covered. Tapping on a track displays a context-menu.

By swiping a track from left to right, or vice versa, a track can be deleted.

Use the button on the bottom right to add a route.

Context menu

Show the Map screen with the track, checkpoints and points of interest. If recording is enabled your travelled track is live updated.

Change the [event title](#) in the event overview

Only visible if the event organisation supports real-time message updates. It can show a small badge on the top right displaying the number of unread messages.

Only visible if the event organisation supports track sharing and if you have enabled [Realtime sharing](#) in the [Settings](#). After clicking this button you can share the link via email, Signal, WhatsApp, etc with your family, friends, ...

or or When all checkpoints are passed **and** uploaded to the event organisation's server, the qrcode will turn green and the [Finish/exit qrcode](#) can be shown if the organisation requests it. This is only possible within the tracking window. See the [Information screen](#). Outside the tracking window, the icon is grey or transparent green when all checkpoints have been passed.

This icon shows the information screen with emergency numbers, event information, order data and when checkpoints are passed. At the top right of the icon is a badge showing the number of checkpoints passed. By default, this badge is red, but when all checkpoints are passed, it turns green.

or or The event can only be recorded in the tracking window. You can find the tracking window timeslots in the [Information screen](#). Outside this window the icon is grey. Once recording has started, the icon changes to a pause button.

3.1.2 Add tracks

After a ticket has been purchased from the event organiser and the eticket has been downloaded, the track can easily be added by scanning the PDF file that has been downloaded for a valid eticket.

If the PDF file contains more than 1 ticket, the App will ask which page is to be scanned. If there is only 1 ticket, this step is skipped.

If the event offers several tracks with for example different distances, the App offers the possibility to choose a track. If there is only one track, this step is skipped.

Warning: Tickets can be downloaded several times. If this happens on different phones, the one who has downloaded last is the **‘owner’** of the ticket. All actions to have the ticket scanned or passing a checkpoint uploaded to the event organisation’s server will fail for the one who downloaded the ticket earlier.

If the track supports realtime news and track updates, your ticket will be invalidated immediately as soon it is downloaded on another phone.

So be careful not to distribute the ticket but to keep it for yourself.

If you want to download the track again, you will have to delete it first.

Note: For example, if an event offers several tracks of different distances, they can all be downloaded one by one. However, only one track can be recorded at a time.

3.1.3 Recording

A live recording of a track can only be done during the event. The tracking window can be found in the [information screen](#). Before and after the event, no recordings can be made. The icon is grey and inactive.

When a live recording is started, the icon will change to a pause button and the background of the recorded track will turn transparent red, so that you can clearly see in the overview which track is being recorded.

You can pause recording and restart it. For example, if you take a break on your route, it is a good idea to stop recording in order to save the battery.

Warning: Only one track can be recorded at a time.

3.1.4 Track status

If the event supports real-time news and track updates, there is an icon in the top left corner of the route overview that indicates the status.

There is an active connection with the event. As soon there is a news message or track update, it will be processed. The connection remains active until the tracking window has expired.

The connection to the server is not active, usually this is temporary. Make sure that you have an active data connection via the mobile data network.

The tracking window has expired and it is no longer necessary to connect to the server.

The ticket has been invalidated. Either it was downloaded on another phone, or it was invalidated by the organisation. Further actions with the event are not possible. It can only be removed from the overview.

3.1.5 Screens

- *Map*
- *Change*
- *News*
- *Finish*
- *Information*
- *Record*

Maps

Overview

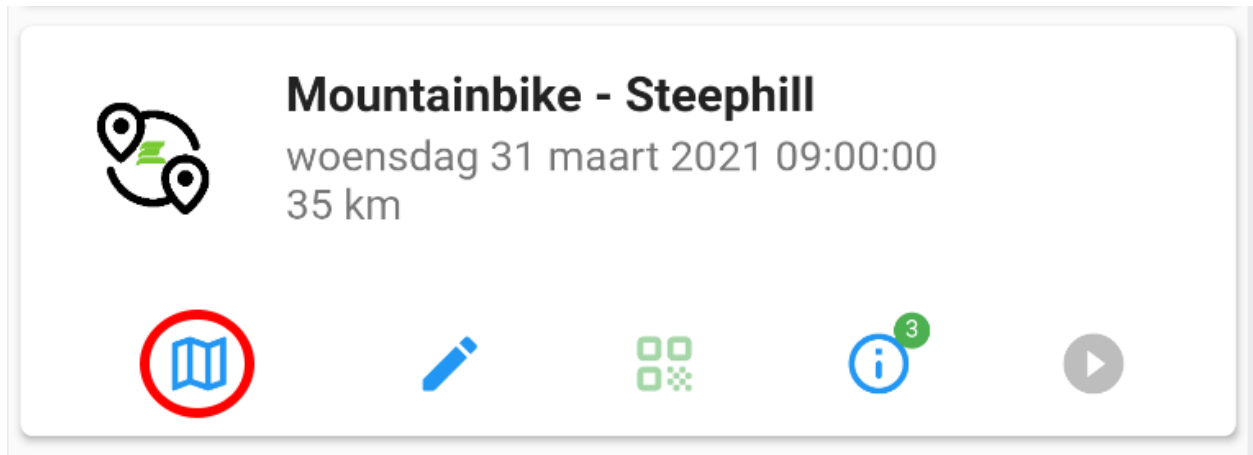

Fig. 2: Tap “Map” button

Stopped

Before the track is recorded, the standard track is just visible and you can see for example which POIs are available on the track and what the track looks like. All checkpoints are also visible on the track as transparent black circles.

Recording

When the track is recorded, the tracked track is visible (blue line) and the distance and speed are displayed at the top of the screen. As soon as a checkpoint is passed, the colour of the circle changes to transparent green. And the date and time are transmitted to the event organiser's server.

Recording can be paused when you take a break to rest, for example. Pausing the recording is a good way to save the phone's battery life.

You can of course still view the recorded track in pause mode and, for example, *Share* the track by pressing the icon in the top right of the screen.

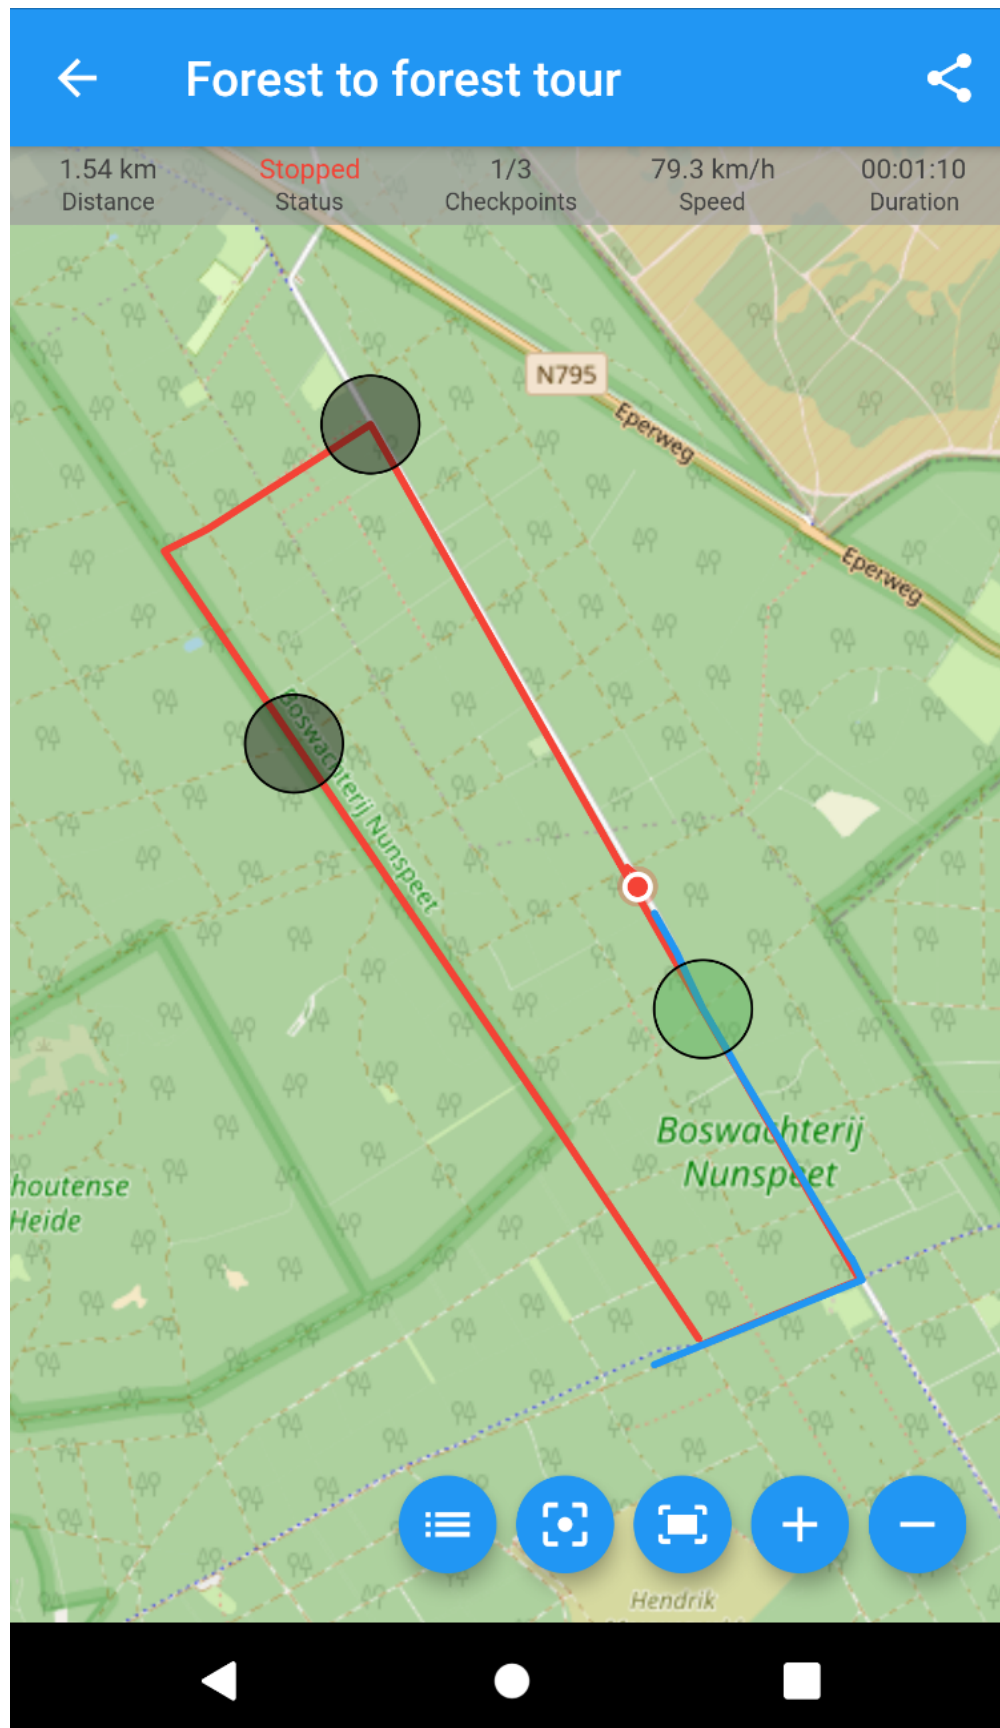

Fig. 3: Recorded Map

Change

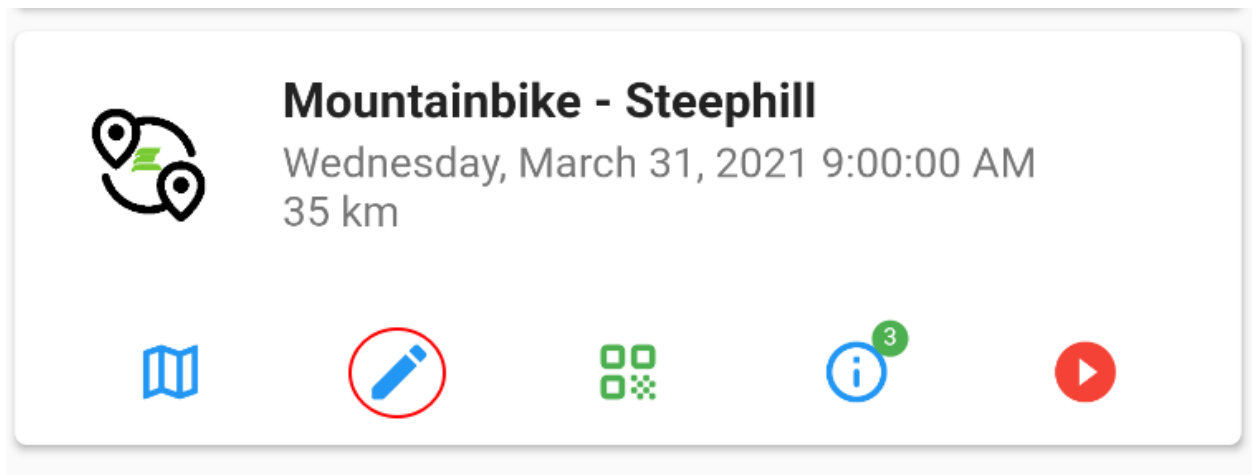

Fig. 4: Tap “Pencil” icon

In the current version of the App, only the name of the event can be changed.

News

The news icon is only visible if the event supports real-time news and track updates. If necessary, the number of new messages is shown in red above the icon. Once the messages have been read, the number will no longer be shown until a new message arrives.

If a track is actively recording, it is very likely that you have the mobile phone in a bracelet or your pocket and therefore cannot see if there are any new messages coming in. You may have earplugs in and be listening to music, for example. In this case, you can use the app's *settings* to indicate that you either want to hear a short sound as soon as there is a new message or that you want to play the message via Text-to-speech.

Finish

When all checkpoints are passed **and** uploaded to the event organisation's server, the qrcode icon turns green and can be shown to the organisation at the end of the track if requested. It can be used, for example, as proof that the entire track has been covered and that a medal or other form of proof of participation will be issued.

Ok

Fig. 9: Finish/exit qrcode

Information

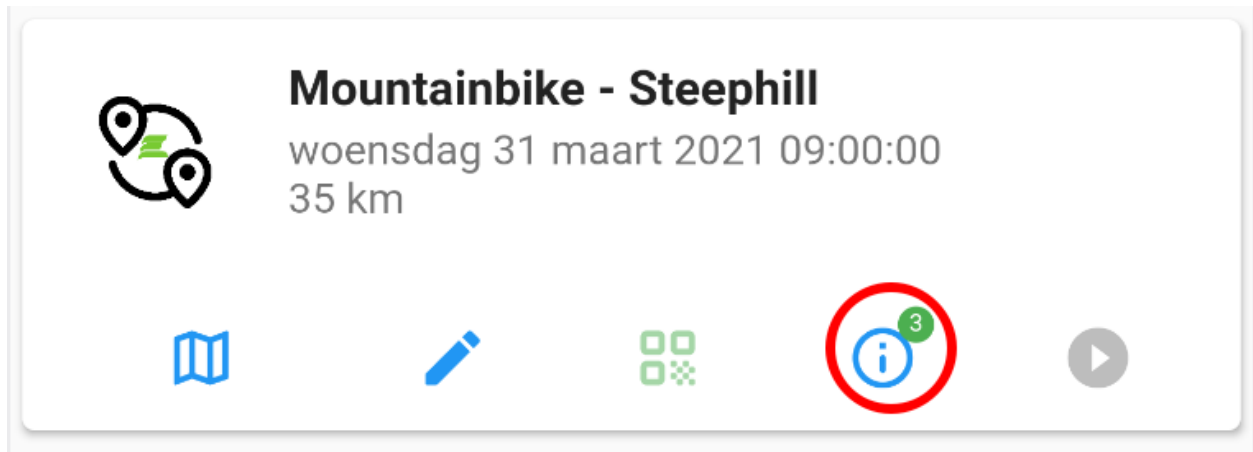

Fig. 10: Tap “Information” icon

The information screen gives an overview of all kinds of information such as emergency numbers, additional information about the event, order data and when checkpoints have been passed. The badge at the top right of the information icon is only green if all checkpoints have been passed. If not, it will be red.

“Help” screen By clicking on the information URL you can view additional information that the organisation provides. You can think of how to drive to the event, parking facilities, etc ... An emergency number is also visible that can be called in emergencies. Always read carefully beforehand the conditions under which the number can be called.

“Information” screen The information screen shows the order data, but also when the event is active, the so-called tracking-window. Only when the event is active, the track can be recorded and the Finish/exit qrcode can be shown to the organisation when requested.

“Checkpoints” screen This screen shows an overview when checkpoints have been passed and when this information has been uploaded to the event organisation’s server.

It can happen that due to a bad network connection, the upload to the event organisation’s server did not take place. Or, for example, because there is no network connection at all and mobile data and WiFi are switched off. All passages of checkpoints must be uploaded to the event organisation’s server, otherwise the finish/exit qrcode cannot be displayed. If the Internet connection is restored, the button can be pressed to perform the upload manually.

“Qrcode” screen This qrcode can be shown, for example, if the organisation does not use “automatic” checkpoints on the route, but instead performs the scans manually.

 **Mountainbike - Steephill**

Information URL

<https://steephilruntest.com>

Emergency phone number

1234567890

Emergency information

We want everyone to enjoy our track. Please make sure that you are well prepared. Nevertheless, it is possible that something happens to you and we would like to help you as best we can. Below are a few steps you can use to decide what to do:

- 1) In case of danger to life, call 112 immediately.**
- 2) If your injury is such that you can continue on your own or with help from others, cycle to the next emergency station. You can see exactly where you are on the track with the App, so you know how far it is to the next first aid station. In that case, do not call the emergency number.
- 3) If the situation is more serious, call the emergency number above. It is also possible to use this number via WhatsApp, which is very convenient in order to give your exact location. If you really cannot cycle any further, then it may be decided that a first-aider should come to the scene with a quad to assess the situation and decide what to do

The track can be recorded between the following time slots

Start
Wednesday, March 31, 2021 8:00:00 AM

End
Wednesday, March 31, 2021 6:00:00 PM

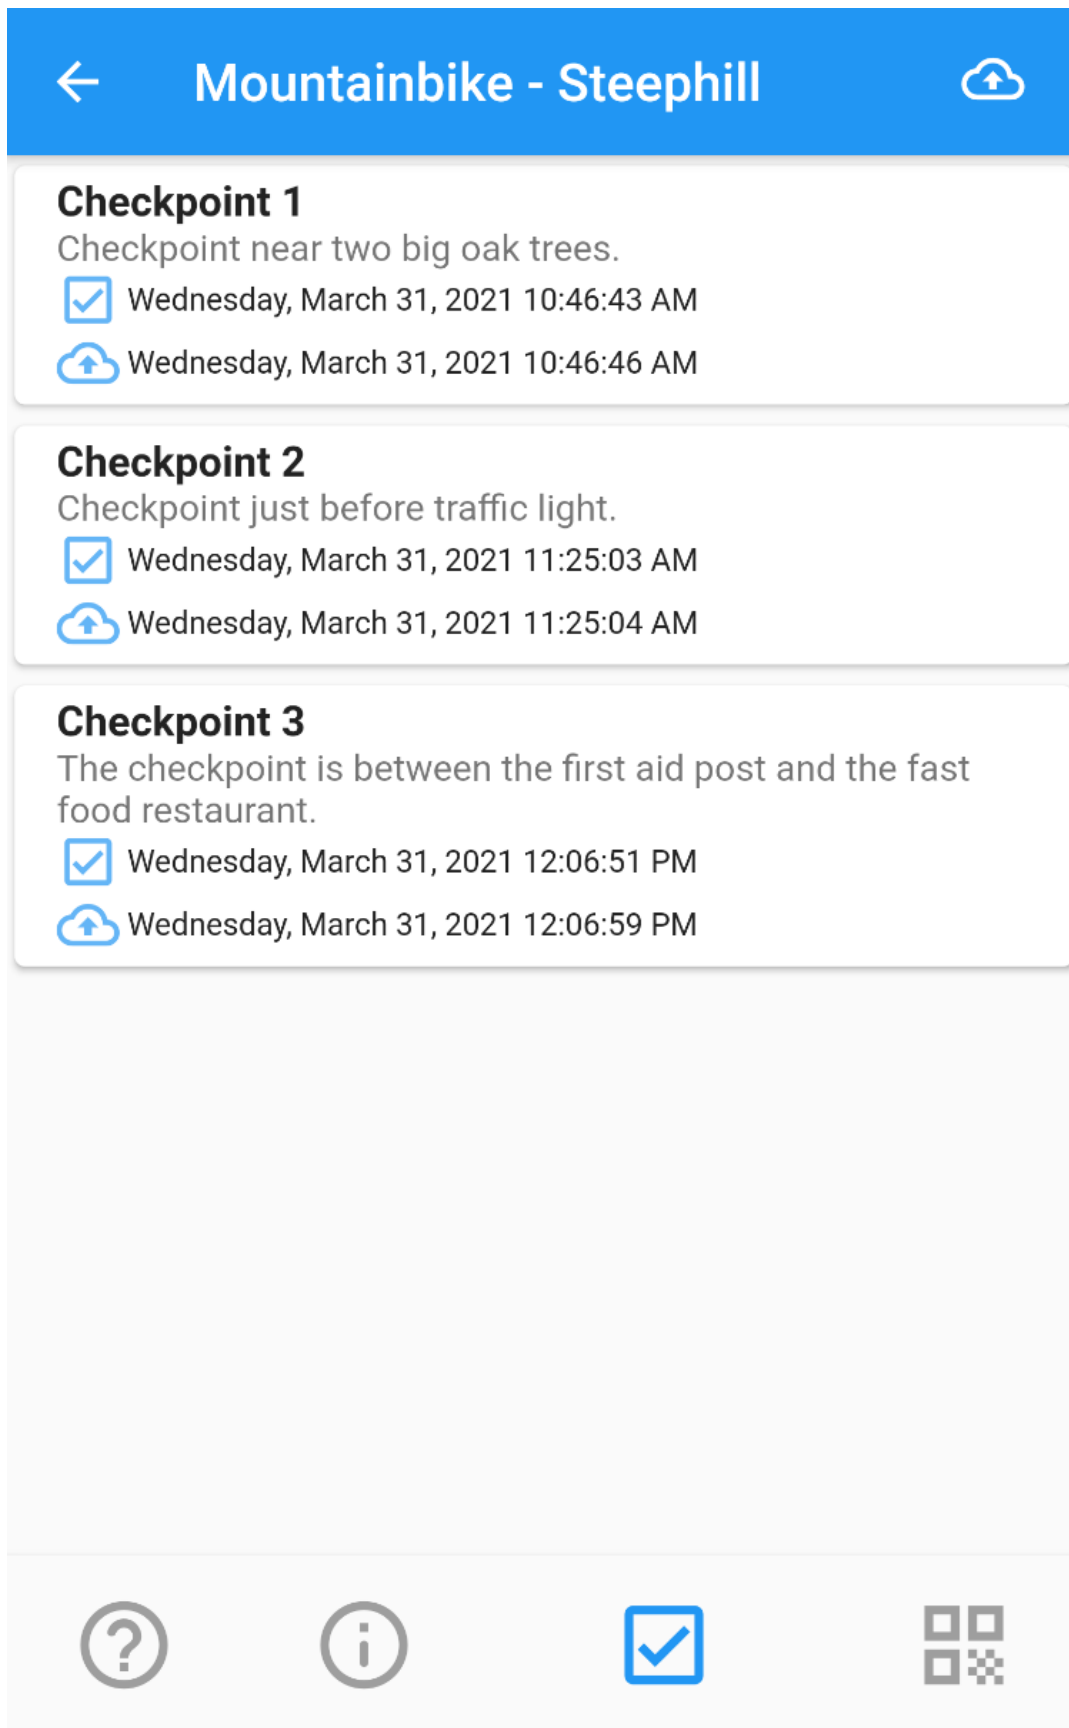

Fig. 14: "Qrcode" screen

Record

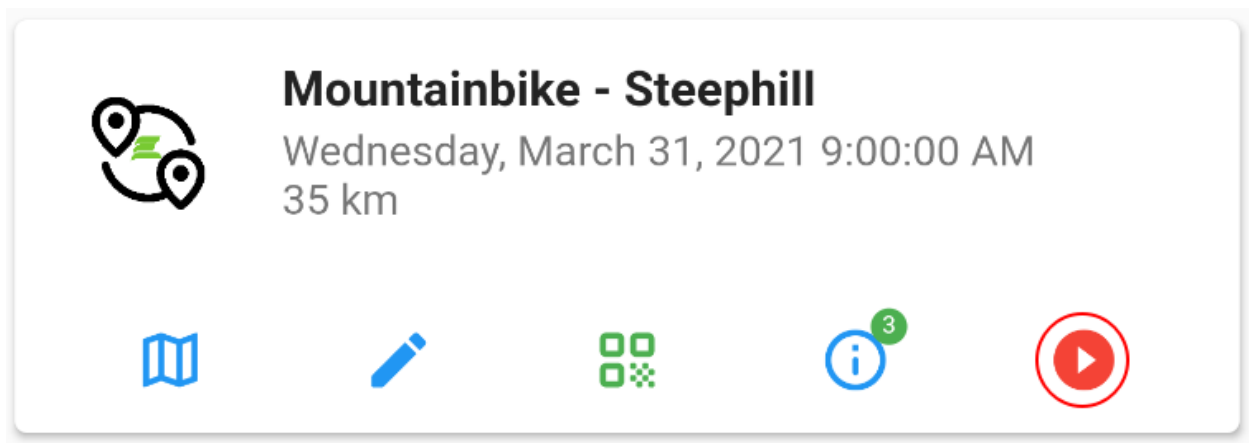

Fig. 15: Tap “Record” icon

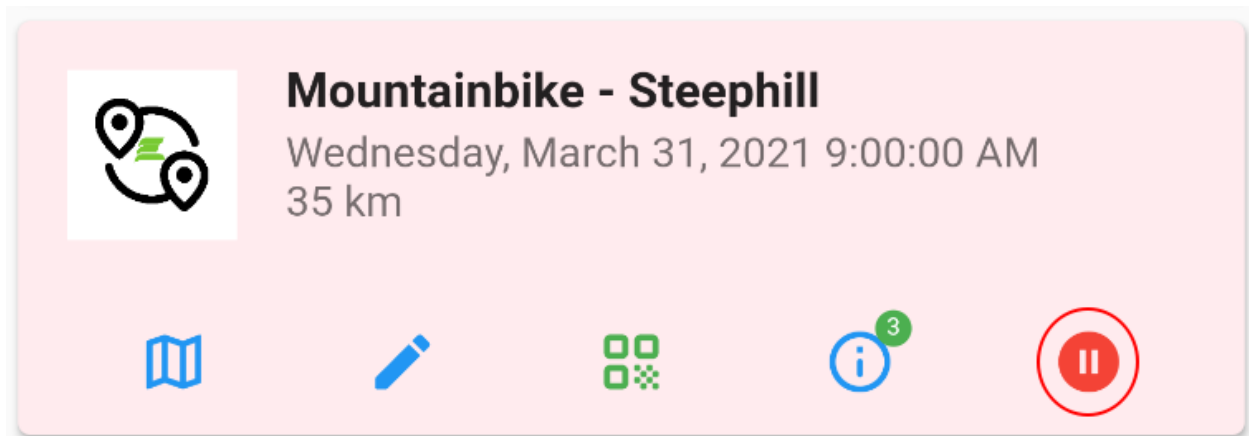

Fig. 16: Pauze recording

If the current event is active, it means that the current date falls within the tracking window. See [Information](#) screen. Once this is the case, the recording icon will turn red instead of grey. Clicking on it will start recording the event; it will record the track travelled and check whether any checkpoints are passed. The background of the event will become transparent red, so that in the overview it is clear which event is being recorded.

Whenever a checkpoint is passed, the counter next to the information icon will increase. The counter remains red until all checkpoints are passed and then it turns green. At the same time, the “Finish/exit” qrcode will also turn green.

Note: Only 1 event can be recorded at a time.

Warning: After recording is turned on, the phone's screen can simply be turned off. However, do not tuck the phone away deep into a bag as this may result in poor GPS reception. Preferably put the phone in a sport armband.

3.2 Shared tracks

3.2.1 Overview

Fig. 17: Overview shared tracks

Fig. 18: Delete a shared track

Add shared track

The only possibility to add a shared track if you have received a link (via email, instant messengers, ...) from a participant. Click the link and the shared track will be added, if it is still valid.

Delete shared track

Deleting a shared track is straight forward. Either swipe the card to the left or the right and delete it.

3.2.2 Shared track map

Fig. 19: Map view shared tracks

Fig. 20: Distance to a Point-Of-Interest

Click on the shared track to show the map. Here you can see the progress of the participant on the track. This can be in real-time or after the participant has travelled at least a certain distance. This is set by the event organisation.

3.3 FAQ

The recording icon is greyed out

Check in the information screen between which times the track can be recorded. No recordings are possible before or after these times.

The finish/exit icon is greyed out

Check in the information screen between which times the track can be recorded. The finish/exit icon button can only be clicked in the recording window.

Track is not recorded if the screen is switched off

Check if all the needed permissions are enabled. See [Permission overview](#). Double check if the location permission is set to `Always` for IOS or `Allow all the time` for Android.

FE Tracking is silently killed in the background

First check if all the needed permissions are enabled. See [Permission overview](#). But you device can also be the victim of aggressive battery optimization policies enforced by some Android device manufacturers. See [Battery optimization](#).

Does *FE Tracking* demand a lot from the battery?

See [Further optimizations](#).

Is *FE Tracking* available for my language?

See [Languages](#).

How accurate is the distance in the Map screen

Fig. 21: Cutting a corner

It depends on the length of the route, whether there are many sharp bends in the track and most importantly, the distance filter defined by the event organisation. The App is optimized for battery-efficiency. It samples the accelerometer periodically while tracking in order to power-down the GPS as soon as the device is determined to be stationary. It uses the distance filter to query for the GPS location. But the filter itself is elastic; the faster you go, the larger the distance filter becomes. And ofcourse the other way around. Usually, the organisation sets this filter to at least 10 metres for a walking track and at least 20 metres for bicycles, for example. So yes, the distance measured may be slightly shorter than the real distance due to cutting corners.

All checkpoints are passed, but the finish/exit qrcode is not green

See the checkpoints tab in the *Information screen*. It can happen that due to a bad network connection, the upload to the event organisation's server did not take place. Or, for example, because there is no network connection at all and mobile data and WiFi are switched off. All passages of checkpoints must be uploaded to the event organisation's server, otherwise the finish/exit qrcode cannot be displayed. If the Internet connection is restored, the button can be pressed to perform the upload manually.

3.4 Donate

Developing, improving and maintaining an App like *FE Tracking* for Android and IOS takes a lot of time. Please consider sponsoring the development of this App or a one-off donation if you enjoy this App.

You can use iDEAL, Apple Pay, Credit card, Bancontact or Giropay.

3.4.1 Choose your amount

Choose your own amount and description
